

IN THE CLAIMS

Please amend the claims as follows:

1.-18. (Canceled)

19. (Currently Amended) An optical distribution network system comprising:  
an optical line termination;  
a first optical network unit connected to said optical line termination through a  
working optical network and a standby optical network; and  
a second optical network unit connected to said optical line termination through said  
working optical network and said standby optical network,

wherein said optical line termination is configured to send a first passive optical  
network section trace (PST) message,

wherein said first optical network unit is configured to receive said first PST message,  
and is configured to switch transmission of data traffic to said optical line termination along  
either one of said working optical network and said standby optical network based on said  
first PST message,

wherein said optical line termination is configured to send a second PST message, and  
wherein said second optical network unit is configured to receive said second PST  
message, and is configured to switch transmission of data traffic to said optical line  
termination along either one of said working optical network and said standby optical  
network based on said second PST message,

wherein the optical line termination is configured to switch transmission of data  
traffic only when a system switching request in a respective PST message from a respective

optical network unit is not dissolved after a predetermined time period.

20. (Previously Presented) The optical distribution network system according to claim 19, wherein said switching transmission of data traffic is performed based on a first selection signal included in said first PST message.

21. (Canceled)

22. (Previously Presented) The optical distribution network system according to claim 19, wherein said switching transmission of data traffic is performed based on a second selection signal included in said second PST message.

23. (Currently Amended) A network system switching method for an optical distribution network system provided with an optical line termination, a first optical network unit connected through a working optical network and a standby optical network, and a second optical network unit connected through said working optical network and said standby optical network, comprising steps of:

sending a first passive optical network section trace (PST) message from said optical line termination;

switching transmission of data traffic to said optical line termination along either one of said working optical network and said standby optical network by said first optical network unit based on said first PST message received from said optical line termination;

sending a second PST message from said optical line termination; and

switching transmission of data traffic to said optical line termination along either one of said working optical network and said standby optical network by said first optical network unit based on said second PST message received from said optical line termination,

Application Serial No.: 09/942,567  
Reply to Office Action dated August 9, 2006

wherein the optical line termination is configured to switch transmission of data traffic only when a system switching request in a respective PST message from a respective optical network unit is not dissolved after a predetermined time period.

24. (Previously Presented) The network system switching method according to claim 23, wherein said switching transmission of data traffic is performed based on a first selection signal included in said first PST message.

25. (Canceled)

26. (Previously Presented) The network system switching method according to claim 23, wherein said switching transmission of data traffic is performed based on a second selection signal included in said second PST message.
